

Amanda L. J. Duffus, Ph.D. is an Associate Professor of Biology at Gordon State College. She has been serving as the GRC's secretary since 2012 and has twice been recognized by the GRC for her contributions to the organization. Amanda has been working with ranaviruses since 2004 and both of her graduate degrees have examined various aspects of *Ranavirus* biology in North America and the UK. While her career has brought her to a place where her primary duties are teaching and mentoring undergraduate students, she is still able to pursue various research threads and remain extremely engaged with the GRC. Her current research is oriented towards undergraduate projects and generally examines different aspects of *Ranavirus* phylogenetics, including which of the 26 core genes are most phylogenetically informative. She is also extremely interested in *Ranavirus* community dynamics and infection/disease emergence in amphibian systems. She is able to pursue this work because of some wonderful collaborators, including members of the GRC!
