*What do we know?

Salamandra salamandra

- *2010: 96% wild mortality in Netherlands
- *2013 & 2014: wild mortality in Belgium
- *2015: UK (trade) and Germany (captivity)
- *2016: Netherlands, Belgium, Germany (wild)
- *Present in: (Vietnam, Thailand, wild salamanders in Asia Japan)
- *museum records in Asia >150 yrs

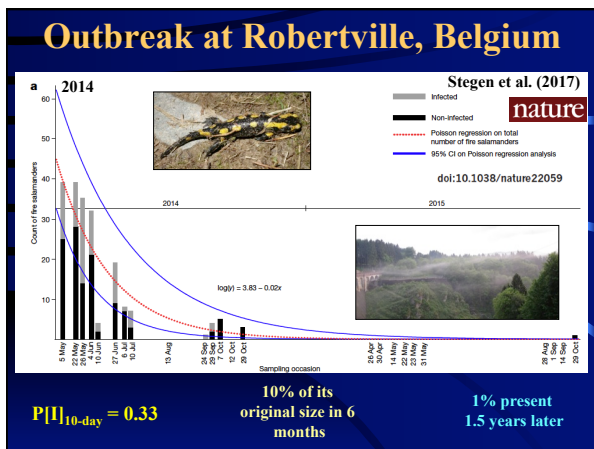

14 of 55 sites: 3 species

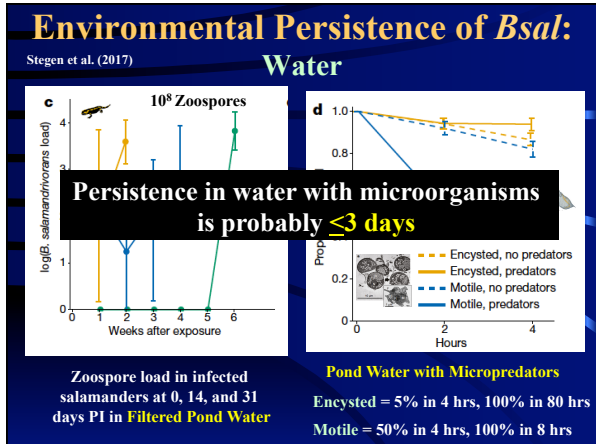

Unknown to occur in North America

Martel et al. 2013, PNAS; Laking et al. 2017, Scientific Reports
Martel et al. 2014, Science;

Ecology of Bsal Summary

We know that Bsal:

- Wide host range including anurans
- Community composition matters for Bsal outbreaks to occur – Hyper-susceptible spp.
- Bsal can infect hosts: 5 – 26 C
- Environmental persistence of Bsal is probably <1 week – can adhere to waterfowl feet

Host reservoir likely is needed!

1. What is the host range of Bsal in North America?
 - i. Amplification, carriers, and dead-end hosts
 - ii. Are there SGCN that are highly susceptible?
2. Can Bsal be amplified and maintained in North American amphibian communities?

Methods

Bsal National Task Force:
Research Working Group

<https://www.youtube.com/watch?v=IMu8Hq2fvZI>

<http://www.salamanderfungus.org>

Results

Of the 28 species tested (>1,000 animals),
ten species (36%; one anuran) have
developed *Bsal* chytridiomycosis:

Plethodontidae

- 1) *Eurycea wilderae*,
- 2) *Pseudotriton ruber*
- 3) *Ensatina e. klauberi*
- 4) *Aquiloerycea cephalica*
- 5) *Chiropetrotriton* spp.

Salamandridae

- 1) *Notophthalmus perstriatus*
- 2) *N. meridionalis*
- 3) *N. viridescens*
- 4) *Taricha granulosa*

Scaphiropodidae

- 1) *Scaphiopus holbrooki*

Bsal Infection Tolerance Rank

Low Tolerance ← High Tolerance

High Risk ← Low Risk

Epidemiological Role:

Carriers (Reservoirs)

Amplification	High	Low	Resistant
---------------	------	-----	-----------

A = High Mortality; High Infection	H = Low – Moderate Mortality; High Infection	L = No Mortality; Low to Moderate Infection	R = No Mortality; No to Low Infection
Drive Epidemics & Possible Spillover to Less Susceptible Species	Serve Both Functions of (A) and (L) – at high zoospore concentrations (A)	Maintain Bsal and Result in Initial Infection Dynamics	

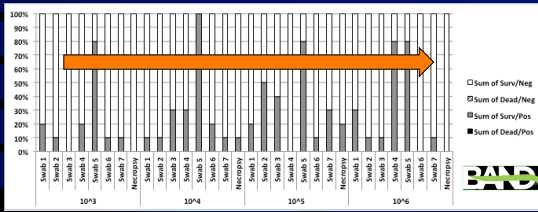

Results

Low Susceptibility Species

Carriers (Reservoirs)

Low Conservation Risk

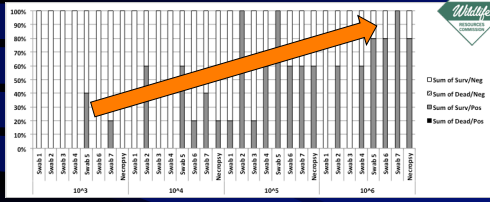

Mexican Axolotl: Carrier Species

Infected at all doses and maintained low-grade infections throughout duration of experiment (6 weeks).

Biomedical and Pet Trade **AXOLOTL CITY** Pathogen Spillover
An online community, marketplace and resources for all things Axolotls.

Green Salamanders and Bsal: Possible Conservation Concern

Dose-dependent response with infection prevalence increasing with time.

If >6 weeks, disease might have developed.

Results

Resistant Species

Dead-end Hosts

No Conservation Risk

Four-toed Salamander: Apparent Resistance

**One Detection on Swab 1
(residual pathogen)**

Subclinical Infection: Salamanders

Possible Resistant Species

N. maculosus (mudpuppy)

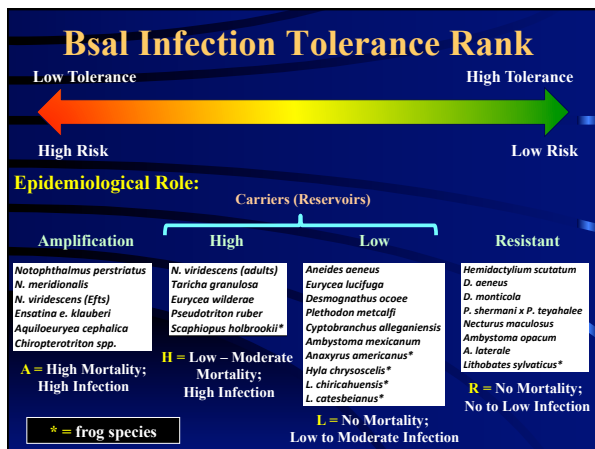

Infrequent detection

D. monticola (seal)

D. aeneus (seepage)

Conclusions

- Most North American amphibian assemblages will be composed of suitable hosts with different tolerances to Bsal infection
 - ➔ Managing composition of amplification, reservoir, and dead-end hosts is a disease intervention option
- All frog species tested (except one) were suitable hosts
 - ➔ Host range of Bsal is greater than expected, which increases the likelihood of entry through trade
- Several SGCN are classified as high risk
 - ➔ Bsal represents a significant threat to U.S. biodiversity

The combination of amplification and carrier species and suitable environmental conditions exist in the USA create the “perfect storm” for Bsal emergence.
